Less routine. More room to grow.

Updating supplier records, sorting customer enquiries, maintaining product descriptions: routine tasks take time away from sales, service and developing your offering. Process automation and generative AI can help give that time back.

The business opportunity is real: a study of European firms estimates an average productivity gain of around **4%** from AI adoption. Complementary investment in software, data and training strengthens the benefits. [1] Transcortex Labs helps you turn that potential into action: automate a suitable process, measure the results and build on what works.

[1] Start with a focused investment

Aldasoro et al. (2026) measure productivity primarily as turnover per employee. Their findings show that AI can improve business performance. So far, the gains are concentrated in medium-sized and large firms, which are better placed to absorb integration costs and complementary investment. [1]

For smaller businesses, the priority is to match the scope of the project to its likely value. We recommend starting with a clearly defined, frequently repeated task whose time requirements can be measured and exceptions managed. This lets you test the benefits in your own business before committing further resources.

[2] Make your existing systems work better together

n8n connects applications through visual workflows. Ready-made integrations and custom connections can bring together your ERP, online shop, CRM and databases. [3] Our approach builds on the systems you already use, adding the connections your day-to-day operations need.

Less manual work between systems. Transfer data between applications, check that required fields are complete and route information to the right place. Your team handles the cases that need attention.

AI where it adds value. Generative AI can extract information from documents, triage enquiries and draft content. Defined rules and human approval guide what happens next.

Control over your systems and data. n8n can run on your own infrastructure with local AI models. Access permissions, retention periods and connected services are planned around your use case. GDPR-compliant processing requires a lawful basis and appropriate technical and organisational measures. [3, 4]

[3] Help small teams do more

An OpenAI analysis finds that people also use AI for tasks outside their own occupational field. Such tasks account for **16.8% of all work-related messages** and **43.5% of occupation-specific messages** in the sample. [5]

For small teams, this opens up useful possibilities: drafting product descriptions, analysing data or writing simple scripts. We turn those possibilities into dependable workflows, with knowledgeable staff reviewing the outputs and retaining responsibility.

[4] Invest in tools, processes and people

Humlum and Vestergaard observe the highest adoption and greatest reported benefits where employers encourage AI use, provide workplace tools and offer training. Around 35% of newly described AI-related tasks concern quality assurance, ethics and compliance. [6]

That is why we combine implementation with hands-on learning. Your team practises on its own workflow, learns to spot common errors and knows when approval is needed. The result is a practical business capability, not just another tool. International research also highlights the importance of digital foundations in accessing AI's benefits. [2]

[5] Turn potential into a business case

What matters is the economic value to your business. We compare the current process with the proposed workflow, including review time, rework and running costs.

Illustrative example, using hypothetical assumptions: a workflow saves 20 hours a month after allowing for review time. At a staff cost of €45 per hour, this frees up capacity worth **€10,800 a year**. A one-off implementation cost of €6,000, plus running costs of €200 a month, brings **total first-year costs to €8,400**.

The return depends on how you use that capacity: for example, to take on more orders or reduce overtime and outsourced work. If salaries remain unchanged, time saved does not automatically reduce costs. These figures are an illustration, not a quotation or a research finding.

Our approach: assess the full cost, establish the business value and expand only after a successful pilot.

[6] Your next step with Transcortex Labs

Founded by Alexander Trümper, Transcortex Labs brings over 15 years of experience in commerce, systems integration and enterprise IT to n8n and generative AI. We support small and medium-sized enterprises (SMEs) from choosing the right use case to day-to-day operation:

- [7] **Define the opportunity and budget.** We identify a worthwhile process, assess the costs and benefits, and agree measurable goals.
- [8] **Build and test.** We connect your applications, add AI where useful, and test routine cases, exceptions and approval steps.
- [9] **Equip your team and build on results.** Your team learns on the working system. We establish who will run and maintain it, then use the results to guide next steps.

Bring us a workflow that takes up too much time. In a free initial consultation, we will explore where automation could help and what you need to make a sound investment decision.

Sources and evidence

Evidence in context: [1] studies AI broadly and finds no statistically significant short-term productivity effect for small and micro firms. [2] compares countries; [5] describes usage, not output quality; [6] covers Denmark through the end of 2024. Study findings are not forecasts of returns on individual projects. Recommendations and the illustrative example are from Transcortex Labs. Sources checked: 8 September 2026.
